

Final Project

The final project is a fundamental part of APM348 and it takes a considerable amount of time to do. So in the first tutorial, we will spend some time on thinking about the modelling topics you are interested in and connecting with potential team mates.

Learning Objectives

In this tutorial you will be introduced to two fundamental tools for Mathematics and Mathematical Modelling:

- $\text{\LaTeX}$ – used to write documents. It is a very useful tool that makes creating scientific documents much easier and better looking.
- Jupyter Notebooks and Python – Jupyter notebooks are installed in UofT servers and they include the Python programming language, so it makes programming and annotating with Python much easier

Problems

1. Work on Start Here.
